IT Security

People are different. Some may like to gamble, while others would rather play it safe. Imagine it is expected that your IT-crew put out a “fire” the day it arises, but your crew has never been trained in fire extinguishing...

Vulnerabilities

Vulnerabilities keep multiplying and the price to keep them under control rises accordingly. If you are choosing not to carry out regular safety checks and diffuse potential vulnerabilities, the task of keeping your company safe will only increase, all the while your IT-safety debt will snowball out of proportion.

Assessments

When all is said and done, you must be able to defend, what you wish to protect. It is the same considerations as when you create a household insurance. You know the risks of something happening are present. You can value your assets and then choose the right insurance.

The same goes for IT-security. How big are your assets? What are the company's possibilities for recovering after a data breach? How long can the company keep afloat with no income if you cannot provide for your customers? How many customers will you potentially lose? And how many employees will lose their job if the company cannot bounce back?

In other words, we must be prepared before an incident occurs, and we must be aware of which safety-measurements we have chosen (not to take) and thereby know our risk. And when that incident occurs, while the attack is happening, the impact must be minimized.

We offer

In collaboration with our strategic partner CStrategy, we offer training of your management and employees so your team can be as prepared as possible. This way you are prepared to maintain the safety levels which you have chosen.

We offer access to vulnerability scanners, enabling you to continuously test patch levels. Moreover, we create playbooks specified to your company, and thereby making sure that all employees know what to do if lightning strikes, keeping your company prepared at all times.

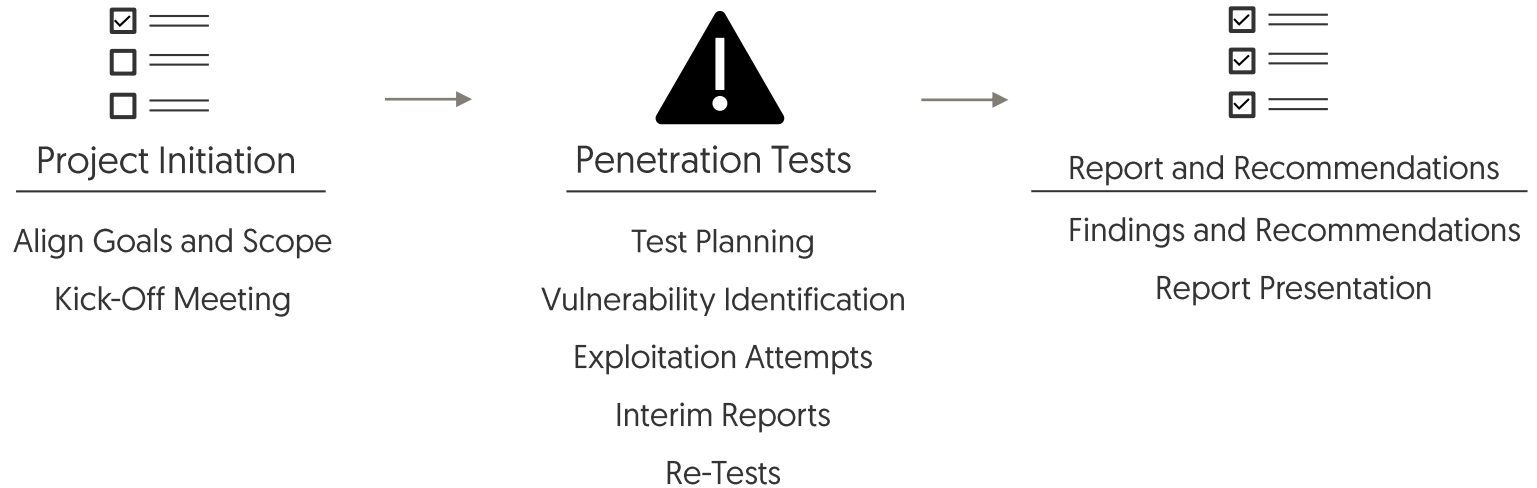

We even offer to be your active sounding board and in collaboration with our experts help to keep unauthorized parties out of the way and make sure no trace of intruders is left behind.

We provide penetration tests from simple setups to larger complex tests, where we in collaboration with you run through actual scenarios, keeping everyone well trained for when the attack happens. Because one day, it will happen - either for your company or the one next door.

Methodology and process

METHODOLOGY: The purpose of the security testing review is to evaluate the customer's overall cybersecurity level of a system/application in the case of malicious attacks.

PENETRATION TEST PROCESS
